

Dialysis users will be prescribed a cocktail of medications to take in conjunction with their dialysis, renal diet and fluid restrictions. A combination of these measures will help users to stay as healthy as possible and keep a good quality of life for as long as they can.

We have listed below some of the most common drug groups used in dialysis. This list isn't exhaustive and if you believe that we should update this information please contact@globaldialysis.com This e-mail address is being protected from spambots. You need JavaScript enabled to view it
