EurekAlert: This study evaluated urine specimens of 90 women with and without UUI symptoms. Samples were collected through a catheter and analyzed using an expanded quantitative urine culture (EQUC) technique. This technique was able to find bacteria that are not identified by the standard culture techniques typically used to diagnose urinary tract syndromes. This study also used 16S rDNA sequencing to classify bacterial DNA. The UUI and non-UUI urinary bacteria differed by group based on both culture type and sequence.
